# WALKER HILDEBRAND

#### TECHNICAL STRENGTHS

**Languages**  $C++\cdot C\#\cdot Python\cdot Javascript\cdot Shell Scripting\cdot Java\cdot SQL$ 

 $\textbf{Tools} \qquad \qquad \text{UNIX} \cdot \text{Git} \cdot \text{Angular} \cdot \text{Node.js} \cdot . \text{NET} \cdot \text{Qt} \cdot \text{MFC} \cdot \text{NoSQL Databases} \cdot \text{OpenGL}$ 

### **EDUCATION**

#### University of Waterloo

Expected Apr 2022

Bachelor of Computer Science (85% major avg)

President's Scholarship of Distinction

## WORK EXPERIENCE

### **NVIDIA** | TensorRT - Graph Compiler Integration

January 2021 - April 2021

- Implemented validation for engine compilation and inference of Tacotron2 + Waveglow speech synthesis using Jasper model for speech recognition, primarily testing dynamic sequence length input
- Developed accuracy tests for TensorRT's INT8 support via Quantization-Aware Training with BERT, compared to ONNX runtime and native PyTorch over the Stanford Question Answering Dataset
- Prepared the release of TensorRT 8.0 by working on several compiler-related, release-blocking bugs

### **NVIDIA** | Hardware Infrastructure

May 2020 - August 2020

- Implemented a QuadTree class and nearest neighbour algorithm using a thin template design
- Optimized object deserialization and cached common resources, reducing boot time from 6 mins to 1
- Implemented several important general enhancements throughout the suite of NVIDIA's CAD tools
- Researched and implemented changes for porting several CAD tools to use an updated version of Qt and summarize methods for faster rendering of objects using the Qt's OpenGL interface

### McAfee | WebAdvisor

Sep 2019 - Dec 2019

- Developed a messaging system between the testing framework and extension that exposed internal functionality to testers, but kept the application's internals secure from the public
- Created a proxy server with C# and Powershell to mimic responses of the extension's HTTPS requests
- Researched, built and modified Chromium source code to provide a McAfee browser proof of concept
- Created an internal tool for manipulating and backing up the LevelDB and IndexedDB implementation of Chrome and Firefox's browser.storage.local API

#### Rocscience | Settle3D Developer

Jan 2019 - Apr 2019

- Created a CAD module to model the construction of complex 3D embankment loads and conduct time-dependant vertical soil consolidation analysis using C++, MFC and OpenGL
- Developed algorithms to validate, discretize, and analyze the loads using a graph-theory approach
- Improved accuracy of settlement analysis while connecting the CAD module to the engine

# Payworks | Testing Automation Framework

May 2018 - Oct 2018

- Deployed the automated testing framework, developing it in C# from a preliminary phase into a working product ready to perform smoke, end-to-end, acceptance and regression tests
- Played a decisive role in the design and implementation of the framework's core architecture
- Reinvented the method of interacting with inconsistent grid components throughout the site, immensely reducing the amount of boilerplate code and greatly improving maintainability

# Soprano for Spotify (Node.js, Firebase, Angular)

October 2019 - Present

- A web app that allows users to setup subplaylists 'trees' songs added to a playlist get added to ancestors
- Leading a small dev team of classmates using skills in project management and software design
- Structured the project to be easily extendible and allow new features such as locking playlists, tracking listening habits, and auto-generate playlists with the user's most listened songs

## C EasyDocs (DeltaHacks V) (Python, SQL, Django & Javascript)

January 2019

- A web application for general practitioners that generates patient information templates, highlighting important data & potential medical issues
- Designed an intricate **SQL** database to relate medical ailments, treatments, side-effects, conflicting medicines, family histories, as well as HCP, patient and scheduling data
- Implemented risk assessment for medical conditions based on patient data & other risk factors
- Analyzed patient illnesses, treatments & side-effects to warn healthcare providers of potential conflicts

#### • LocalizeCS (Bash)

October 2018

- Created a command-line program allowing users to create and sync local versions of remote environments as a solution to the frustrations of completing assignments on UWaterloo's remote servers
- Built Git-inspired functionality to push, pull, sync and "diff" changes between the environments
- Implemented features that allow remote execution of commands and easy connection to the remote
- Shared the program amongst classmates and peers who frequently use it for assignments

### Bite-sized fun Projects (Various Languages)

- • FoosBoard A modular express application that allows users to track workplace foosball games via Slack with team names, smart leaderboards and player stats
- • 10FasterFingers Chrome extension that allows users to cheat on several typing test websites. Used a javascript OCR library to outwit the anit-cheat measures.
- • Ride The Bus Developed a program in C# that simulates a card game. Programmed and analysed different playing strategies and their efficacy
